CONTINUITYMAP

Essential services rely on one another.

A clearer way to review service dependencies and practice what-if scenarios

If one service is interrupted, what does your plan say depends on it?

FICTIONAL DEMONSTRATION · PLANNING SUPPORT ONLY

THE PROBLEM

The challenge is knowing what is connected.

Different teams often hold different pieces of the continuity picture.

PLANNING INSIGHT

- Plans describe recovery steps.
- Equipment lists name facilities and backups.
- Service owners know exceptions and open questions.

TAKEAWAY

The planning task is to connect records, owners and evidence.

Information planners may need to reconcile

Continuity plans

Recovery steps and assumptions

Asset lists

Facilities and equipment

Service owners

Local knowledge and exceptions

THE PRODUCT

One workspace for the dependency review.

List services → attach evidence → ask owners to review → run an exercise → record actions.

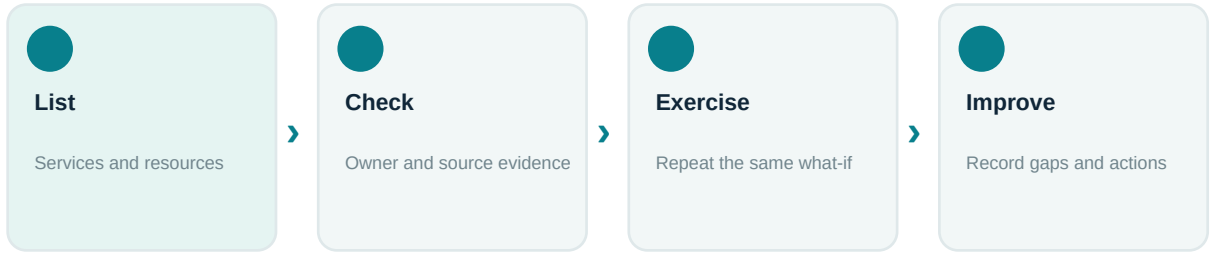
PLANNING INSIGHT

- See which service supplies another and which service relies on it.
- Keep confirmed links separate from suggestions and questions.
- Repeat an exercise and inspect the evidence behind each result.

TAKEAWAY

A human review is required before a suggested link counts.

A simple review cycle



EVIDENCE MODEL

Every relationship has a reason to check.

A line on the map points to a record with an owner and source.

PLANNING INSIGHT

- Arrow: the provider supplies something the dependent service needs.
- Evidence: a quote and reference show where the claim came from.
- Review status: verified, proposed, unknown or rejected.

TAKEAWAY

A relationship is a reviewable record, not just an arrow.

One fictional relationship

Substation Alpha → Water Treatment

Power · VERIFIED · ANY backup group · CM-DEMO-01 §05 · checked 1 Oct 2026

Follow the path and inspect each link.

Select a service to see what it relies on, what relies on it, and what needs review.

PLANNING INSIGHT

- Expand the map around a service.
- Open a relationship to read its evidence and owner.
- Edit a declaration and rerun the same exercise.

TAKEAWAY

The map supports a conversation between planners and service owners.

What a planner can inspect

Service

Name, sector and exercise status

Impact path

The verified links behind a result

Open question

A possible link for owner review

SCENARIO LOGIC

Backups need a clear rule.

A service is affected only when a required group of verified providers is no longer available.

PLANNING INSIGHT

- ANY: one available provider is enough.
- ALL: every listed provider is needed.
- A service may need several groups at the same time.

TAKEAWAY

The app rechecks links until no new service is affected.

A small example

ANY

either is enough

Utility power OR a generator → power need remains met if one is available.

ALL

both are needed

Power AND network access → the need is unmet if either is unavailable.

Three fictional what-if exercises.

The same calculation handles a single outage, simultaneous losses and an alternate route.

PLANNING INSIGHT

- Substation Alpha loses power.
- East water pumping loses utility power and backup.
- Regional communications go down; radio remains separate.

TAKEAWAY

The exercise rules are repeatable and visible.

The 43-item Northbank demo

Electricity

Utility and backup generation

Water

Treatment, pumps and users

Communications

Telecom, fiber and radio

DEMO RESULT

Alpha outage: what the demo records say.

Some services remain available under their declared backup rules; other recorded paths are affected.

PLANNING INSIGHT

- 17 unavailable entries: the starting site plus 16 downstream results.
- Water treatment remains available through its declared solar backup.
- 2 open paths need review; they are not counted as failures.

TAKEAWAY

These are graph results, not predictions of real outages.

One example path · fictional records

STARTING DISRUPTION	Northbank Substation Alpha
AFFECTED PATH	Alpha → Data Center → Health Records
AFFECTED SERVICE	Northbank General Hospital
OWNER REVIEW	Shelter and archive questions

AI ASSISTANCE

AI can suggest links from plan text.

A local model can find a possible relationship and attach the sentence that supports it.

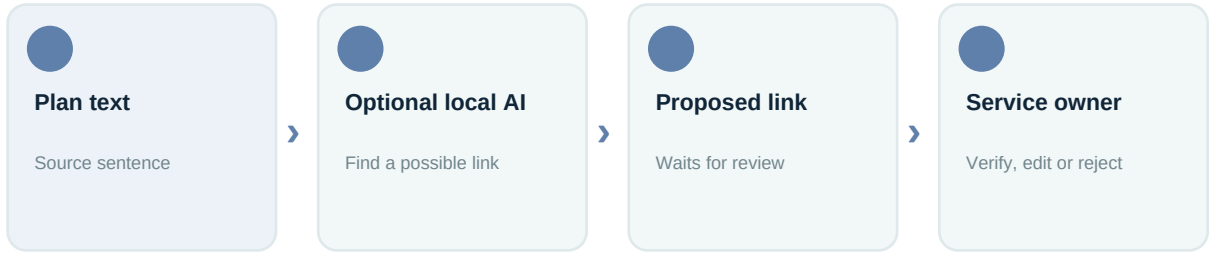
PLANNING INSIGHT

- Upload fictional plan text in a supported file format.
- Match names to services already in the graph.
- Send every suggestion to an owner for review.

TAKEAWAY

No cloud AI is required, and AI cannot verify the link.

A suggestion stays a suggestion



GOVERNANCE

People remain responsible for decisions.

AI text can inform a review; an accountable service owner decides what is accepted.

PLANNING INSIGHT

- Only verified links affect the calculated status.
- An assessment cites records and does not change service status.
- Review and scenario actions are recorded in the local audit log.

Prototype safeguards

Evidence

Keep source quote and reference

Human review

Owner accepts or declines

Unknowns

Do not invent missing values

TAKEAWAY

The prototype is local demo software, not production security.

MARKET POSITION

Work alongside existing resilience platforms.

The product idea is transparent, editable evidence and repeatable dependency exercises.

PLANNING INSIGHT

- Dependency maps and crisis dashboards already exist.
- Everbridge Bridge publicly describes dependency mapping and continuity workflows.
- Test the evidence-review workflow with buyers before claiming a gap.

TAKEAWAY

Differentiation and buyer fit remain hypotheses to validate.

An early positioning hypothesis

ContinuityMap prototype

Local demo · inspectable evidence · human review · repeatable graph exercise

Everbridge Bridge · public description

Continuity plans · dependency mapping · impact tolerance · response workflow

COMMERCIAL MODEL

Illustrative pricing, with assumptions visible.

One example: annual subscription plus site fees and an onboarding project.

PLANNING INSIGHT

- $65k base + 3 × $9k/site = $92k annual recurring revenue.
- $28k onboarding makes first-year revenue $120k.
- $30k direct cost leaves $90k gross profit (75%) in year one.

TAKEAWAY

Gross profit excludes engineering, sales, tax and company overhead.

Illustrative first-year gross profit · USD

ORGANIZATIONS	YEAR-ONE REVENUE / GROSS PROFIT
1 organization	$120k revenue · $90k gross profit
5 organizations	$600k revenue · $450k gross profit
10 organizations	$1.20m revenue · $900k gross profit
25 organizations	$3.00m revenue · $2.25m gross profit

Model: $92k recurring + $28k onboarding · $30k direct year-one cost per organization.

A small, familiar stack runs the demo.

The app can run locally, with no cloud AI or graph database required.

PLANNING INSIGHT

- React draws the map; FastAPI provides the API.
- NetworkX calculates impacts; PostgreSQL saves records.
- Ollama is an optional local AI service.

TAKEAWAY

The prototype is feasible; customer deployment needs hardening.

Possible next build steps

0–3 months

Interview owners · confirm data fields · pick a safe pilot

3–6 months

Customer-controlled pilot · accounts · review workflow

6–12 months

Approved integrations · stronger audit and security

VALUE & RISKS

Start small, with one service owner.

Choose a safe dataset, review its evidence and run one scenario together.

PLANNING INSIGHT

- Measure time to prepare an exercise and review its result paths.
- Biggest risk: incomplete, old or disputed dependency records.
- Continue only if owners can explain and trust the evidence.

TAKEAWAY

The tool makes assumptions easier to inspect; it cannot fix bad data.

A bounded pilot

Choose

One service group and safe data

Review

Named owners and evidence

Exercise

A fixed what-if with known answers
